# ROUTINE EEG

e\*lec\*tro\*en\*ce\*pha\*lo\*gram

A routine EEG (e\*lec\*tro\*en\*ce\*pha\*lo\*gram) records your brainwave activity for 20–30 minutes. This is done by placing a cap with small electrodes on the scalp. Once completed, the recording of the brainwaves are interpreted by **Dr. Randi Baculi**.

This procedure assists greatly with diagnosing disorders related to **seizures, epilepsy, sleep, dementia, stroke, memory**, and so much more!

*Please ensure that you arrive to your appointment with the following:*

- 1) A clean scalp, and **do not** use hair spray, hair gel, mouse, or braids.*
- 2) Eat your meals normally (try to avoid any caffeinated drinks)*
- 3) Take medications as instructed by your provider.*

Lastly, please notify us if you have a new piercing on your ear lobe(s) or other similar circumstances that may interfere with the study's clinical quality.
